Sequence 5822, Application US/09134000C

Patent No. 6617156
GENERAL INFORMATION:
APPLICANT: Lynn Dougette-Stamm et al
TITLE OF INVENTION: BYTENCOCCUS PAECALIS FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: BYTENCOCCUS PAECALIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERBNGE: 032796-032
CURRENT APPLICATION NUMBER: US/09/134,000C
CURRENT APPLICATION NUMBER: US 60/055,778
PRIOR PILING DATE: 1997-08-15
NUMBER: OF SEQ ID NOS: 6812
SOFTWARE: Patentin version 3.1
SEQ ID NO 5322
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ORGANISM: Enterococcus faecalis

Sequence 8112, Application US/09489039A

Patent No. 6610836
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/489,039A

CURRENT FILING DATE: 2000-01-27

PRIOR PILING DATE: 1999-01-29

NUMBER OF SEQ ID NOS: 14342
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GENERAL INFORMATION:

Patent No. 6699703

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic Acid and Amino Acid Sequences Relating to Streptococcus

TITLE OF INVENTION: Prenumoniae for Diagnostics and Therapeutics

TITLE OF INVENTION: Prenumoniae for Diagnostics and Therapeutics

TITLE OF INVENTION: PATHOLO-07A

CURRENT PELING DATE: 2000-05-26

PRIOR PILING DATE: 1998-06-30

PRIOR APPLICATION NUMBER: US 60/085,131

PRIOR PILING DATE: 1998-06-30

PRIOR PILING DATE: 1998-06-30

PRIOR FILING DATE: 1999-07-02

NUMBER OF SEQ ID NOS: 5322

SEQ ID NO 2958

Sequence 4715, Application US/09134000C

Patent No. 667156
GENERAL INFORMATION:
APPLICANT: Lynn boucette-Stamm et al
TITLE OF INVENTION: BNTERCOCCUS FAECALIS FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: BNTERCOCCUS FAECALIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 032796-032
CURRENT APPLICATION NUMBER: US/09/134,000C
CURRENT APPLICATION NUMBER: US 60/055,778
PRIOR APPLICATION NUMBER: 1999-08-13
PRIOR APPLICATION NUMBER: US 60/055,778
NUMBER OF SEQ ID NOS: 6812
SCPTWARE PATENTIN Version 3.1

Corynebacteium glutamicum nucleic acids encoding phosphoenolpyruvate: sugar phosphotransferase system proteins or their portions, useful for typing or identifying C. glutamicum or related bacteria, and as markers for transformation.

Claim 4; Page 101-102; 144pp; English.

The present invention relates to Corynebacteium glutamicum phosphoenolpyruvate: sugar phosphotransferase system (PTS) proteins. The PTS nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria, the typing or identification of C. glutamicum or related bacteria, as reference points for mapping C. glutamicum genome, and as markers for transformation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the isolation of Corynebacterium glutamicum metabolic pathway (MP) proteins, and the polynucleotide sequences encoding them. The MP proteins are enzymes involved in the metabolism of molecules important for the normal functioning of cells (e.g. amino acids, vitamins, cofactors, nucleotides and nucleosides, or trehalose). The polynucleotide sequences encoding the MP proteins are useful for producing fine chemicals, particularly organic acids, non-proteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleotides, lipids, (un) saturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes. The fine chemicals are useful in the food, animal feed, cosmetic or pharmacoutical industries, ABG80321-ABG80343 represent the C. glutamicum
                                                                                                                                                                                                                                                                                                                                                                                                                            9

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                     mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.
                                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotides derived from Coryneform bacteria, for identifying

Gene encoding sucrose phosphoenolpyruvate-sugar transport system enzyme II obtained by cassette ligation-mediated amplification of downstream domain of coryneform bacterium sucrase gene, with sucrose-binding

Claim 1; Page 29-32; 45pp; Japanese.

ö

The present sequence represents the Brevibacterium lactofermentum sucrose PTS (phosphoenolpyruvate:carbohydrate phosphotransferase system or phosphoenolpyruvate-sugar transport system] enzyme II, which has sucrose-binding activity. A coryneform bacteria produced with the sucrose PTS enzyme II gene can have more efficient sugar uptake, and improved aminodistrupted gene, such as one without the sucrose PTS gene and it's to produce new breeds of coryneform bacterial strains to uptake sugar more efficiently e.g. glucose only or and sucrose, and can have improved amino-acid and nucleic acid productivity. (Updated on 11-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to Corynebacteium glutamicum phosphoconolpyruvate: sugar phosphocransferase system (PTS) proteins. The PTS nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria, the typing or identification of C. glutamicum or related bacteria, as reference points for mapping C. glutamicum genome, and as markers for transformation

The invention relates to Enterococcus faecalis polynucleotides and polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector
                                                                                                                                                                                                                                    300

comprising the nucleic acid and a cell comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Entercoccus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   VYSPIVITGLHQSFPPIELELFNQ-----GGSFIFATASMANIAQGAACLAVFFLAKSE 174

The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
t are useful for selecting probes and primers for detecting genes in L.

control of the control of the present sequence is a protein
control of the genome sequence of the present invention. Proteins
concoded by the genome sequence are useful for raising specific
antibodies, identification of L. monocytogenes and related organisms, and
for biosynthesis and biodegradation, especially biosynthesis of vitamin

CC antibodies, identification of L. monocytogenes and related organisms, and
EL. The genome sequence and proteins encoded by it are also useful for
call ompounds that regulate gene expression and cell replication
and modulate L. monocytogenes-related diseases. In addition, the genome
cc and modulate L. monocytogenes-related diseases. In addition, the genome
cc sequence and proteins encoded by it are useful in pharmaceutical and
caccines compositions for the treatment or prevention of infections by L.
cmonocytogenes and related organisms. Note: The sequence data for this
controlic format directly from MIPO at
the wine in the Aminished organisms of the wine or the was obtained
the wine in the Aminished organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

the invention tenates to an instract actual computation and pure invention tenates to an instract actual completes of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypoptide whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense confisced coid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular or proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway or the gene product or that has an activity against a biological pathway or proliferation; (7) identifying a compound that influences the activity of identifying a gene required for callular proliferation or the biological pathway or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound; activity; (11) a culture compound that inhibits proliferation of an organism acts; (13) identifying the target of a compound that inhibits the crompound organism; or (13) identifying the target of a compound that inhibits the crompound organism; or (13) identifying the target of a compound that inhibits of compounds or screening for homologous nucleic acids required confident proverse andidate molecules for rational and any acceptance or includes acids are useful for any proverse proverse andidates molecules for a genine and acids are useful for any proverse proverse and acceptance or and acids are useful for any proverse proverse and acceptance or and acids are useful for any proverse proverse and acceptance or and acids are useful for any proverse proverse proverse and acceptance or acids are useful for any proverse proverse prover
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      one of
                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Zyskind JW;

Claim 1; SEQ ID NO 3912; 56pp; English.

The invention relates to a protein computers, identified in the identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regalons from the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regalons from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence contained within a Streptococcus nucleic acid sequence. The first primer is substantially complementary to the complement of sequence contained within a Streptococcus nucleic acid sequence to the target sequence, and where the parts of the primers having substantial complementarity define the termin of the target sequence to protein, and determining where the termin of the target sequence to protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes conding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful for identifying encoding the proteins and antibiotics. The methods are useful for identifying tention or more genes or infection. They are also useful in developing vaccines, and antibiotics. The methods are useful for identifying expressed by the identified coding regions from the genomic sequence. Specification, but was obtained in electronic format directly from WIPO at Eth. Publybublished pot sequences. (Updated on 23-OCT-2003 to

a Streptococcus pneumoniae genomic sequence, a fragment or degenerate variant of the polymucleotide or a nucleic acid sequence 95% identical to one of the polymucleotides. The S. pneumoniae polymucleotides and encoded polympeptides (ABPR1299-ABPR1674) are useful for treating or preventing S. are induced or exacebateed by S. pneumoniae. These are also useful for pneumoniae in a biological sample or diagnosing S. pneumoniae in a biological sample or diagnosing S. pneumoniae in a subject. The polymucleotides have antibacterial activity and are useful in gene therapy The invention relates to isolated polynucleotides (ABZ72147-ABZ42522) of

The nucleic acids and proteins are useful for diagnoshing, preventing and treating pathological conditions resulting from bacterial infection, such as S. pneumoniae infection. These may also be used for drug screening procedures. The present sequence represents a Streptococcus pneumoniae polypeptide of the invention. Note: The sequence data for this patent did not appear in the printed specification but was obtained in electronic format directly from USPTO at

The present invention relates to the genome sequence of Listeria

CC monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.

CC monocytogenes and related organisms, and for studying genets in L.

CC polymorphisms and other genomes. The present sequence is a protein

CC polymorphisms and other genome sequence of the present invention. Proteins

CC polymorphisms and other genome sequence of the present invention. Proteins

CC polymorphisms and biodegradation, especially biosynthesis of vitamin

CC antibodies, identification of L. monocytogenes and related organisms, and

El2. The genome sequence and proteins encoded by it are also useful for

CC selecting compounds that regulate gene expression and cell replication

CC sequence and proteins encoded by it are useful in pharmaceutical and

CC and modulate L. monocytogenes-related diseases. In addition, the genome

CC sequence and proteins encoded by it are useful in pharmaceutical and

CC vaccines compositions for the treatment or prevention of infections by L.

CC monocytogenes and related organisms. Note: The sequence data for this

CC patent did not form that from MIPO at

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus progenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detect Streptococcus in such as a vaccine or diagnostic composition. The disease caused by used as a vaccine or diagnostic composition. The disease caused by streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity encoder and active acids and distinguishing/identifying
                                 Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        13;

Exteriorous teracus to an instruction deliberative incomposition one of 10 fully defined sequences given in the (or comprishing 40 one of 10 fully defined sequences given in the (or comprishing 40 one of 10 fully defined sequences given in the (or comprishing 40 one of 10 fully defined sequences given in the incleid acids, its complement or sequences hybridishing to it). Also included are a crecombinant vector comprishing the mucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the mucleic acid. The nucleic acids are consen from 3654 disclosed sequences encoding 3654 disclosed proteins. Or the nucleic acids is useful for diagnosing pathological conditions resulting from E. faccium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans and vaccines containing the mucleic acid are useful for preventing or treating Enterococcus faecium infections. The present sequence represents one if the disclosed E. faecium proteins.
                                                                     343

```

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes there later the prokaryotes used are Escherichia configuration of proteins. The prokaryotes used are Escherichia selected in Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Seudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify antibodies capable of binding to the express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous of organisms. The present sequence represents an essential prokaryotic cludar proliferation protein. Note: The sequence data for this patent of calcular proliferation protein. Note: The sequence data for this patent of electronic form part of the printed specification, but was obtained in the way of the proposition of programme for the printed sequences. New polynucleotides for the identification and development of antibiotics, comprise sequences of antisense nucleic acids. Example 3; SEQ ID NO 13467; 511pp; English.
